

No look-ahead: CAFÉ's past imputations are frozen; batch methods leak

imputed value at cell ($t_0 = 60, j = 1$)

target window ends at $t = 60$ (everything right of this is future)

- SoftImpute (non-causal batch)
- CAFÉ (online, point-in-time)

CAFÉ: invariant to the future
(frozen once t has passed)

SoftImpute: estimate of the
past drifts as future is revealed

prefix length L (rows of history given to the imputer)
